

# CASP 9

## **EVALUATION OF RESIDUE-RESIDUE CONTACT PREDICTION**

*Bohdan Monastyrskyy*

*Andriy Kryshfovych*

*Krzysztof Fidelis*

**Bohdan Monastyrskyy**

## Evaluated domains:

- Analysis performed on FM and TBM/FM domains only
- 1 domain (T0537\_D2) not considered due to its short length - 31 residues
- 28 domains total

## Participating groups:

- 28
- 25 submitted predictions for the evaluated domains

## Format of predictions:

- Residue pairs in contact
- Probability scores for contacts

Probability scores were used to rank and select predicted contacts

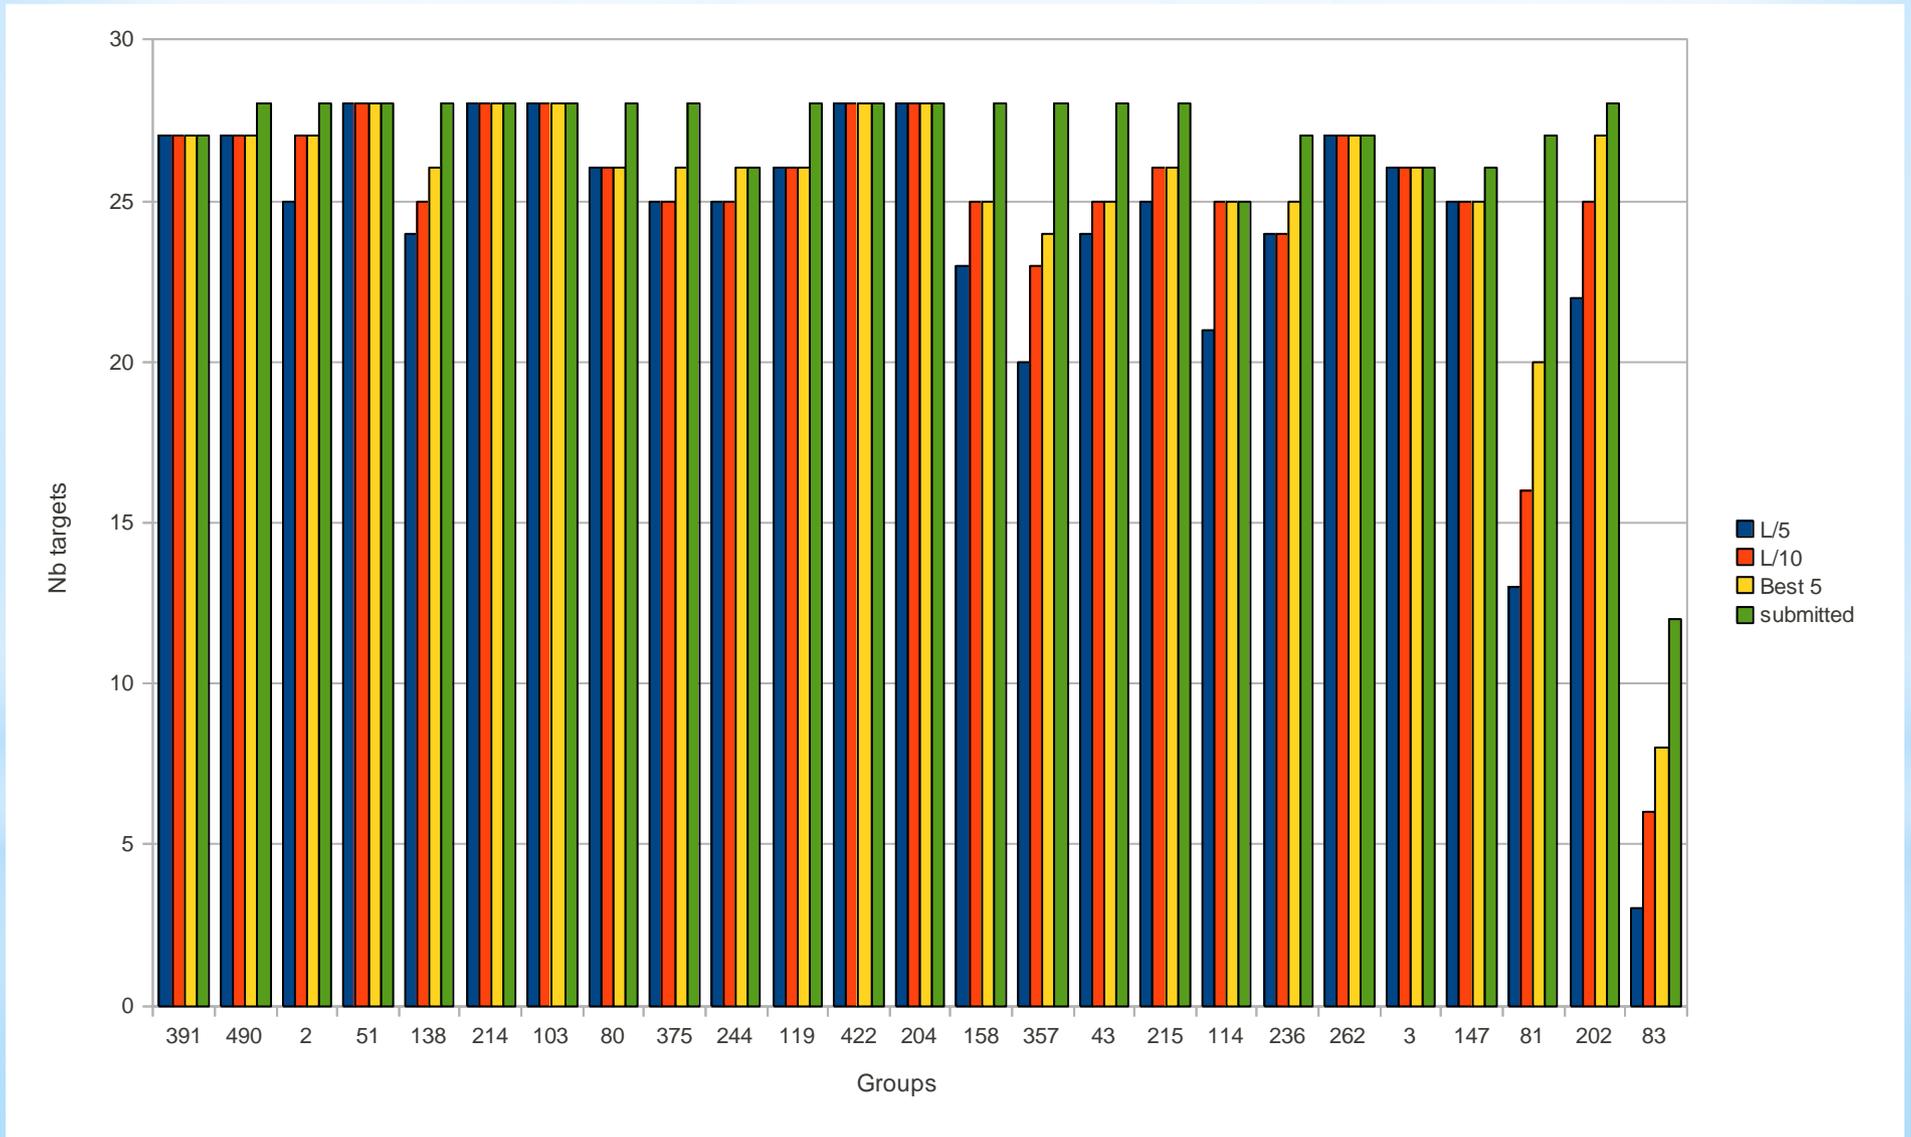

## Evaluation:

- Evaluation performed on predictions ranked as #1
- Only long range contacts considered (separation along the sequence  $\geq 24$  residues)
- For each target domain of length  $L$ , 3 sets of top ranked contacts were considered, comprising  $L/5$ ,  $L/10$ , and just 5 predictions

Not all groups submitted sufficient number of contacts to be evaluated

# Numbers of predicted targets per group

## Evaluation scores:

As in previous CASPs two scores for evaluation of contact predictions were used:  $Acc$  and  $Xd$

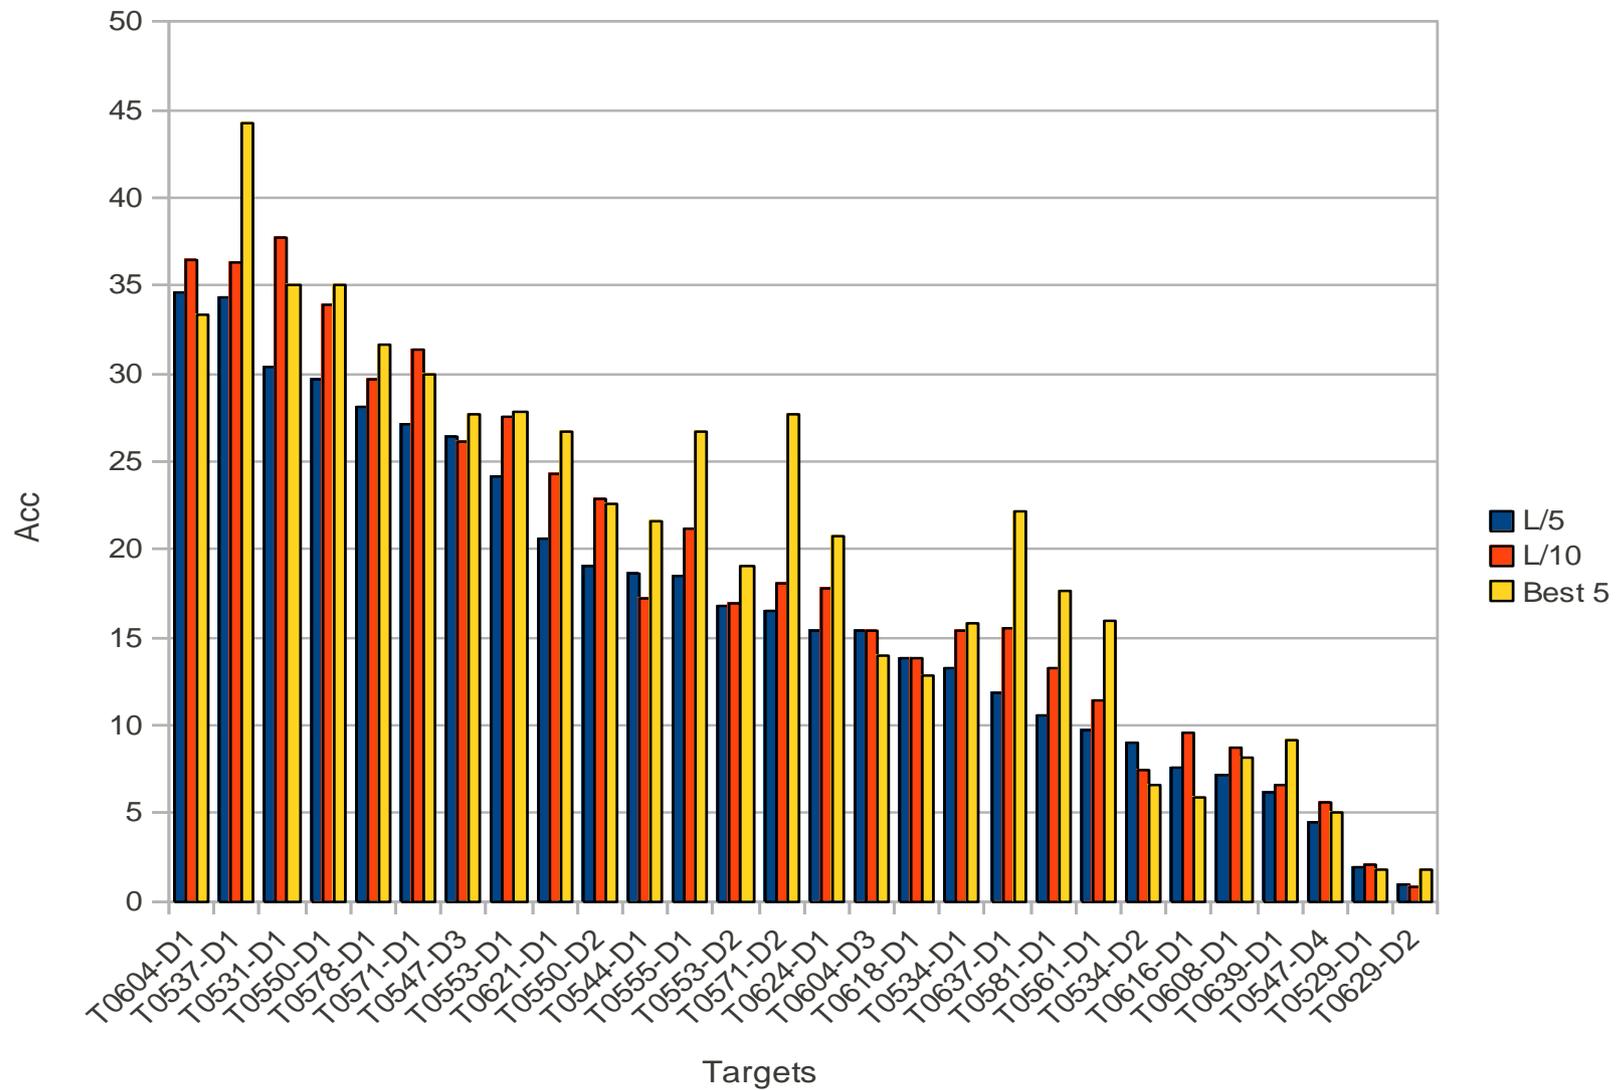

$$Acc = \frac{TP}{TP + FP}; \quad Xd = \sum_{i=1}^{15} \frac{(Pp_i - Pa_i)}{i},$$

$Pp_i$  – percentage of predicted pairs  
with distance  $d \in [4(i-1), 4i]$ ;

$Pa_i$  – percentage of all pairs of target  
with distance  $d \in [4(i-1), 4i]$ ;

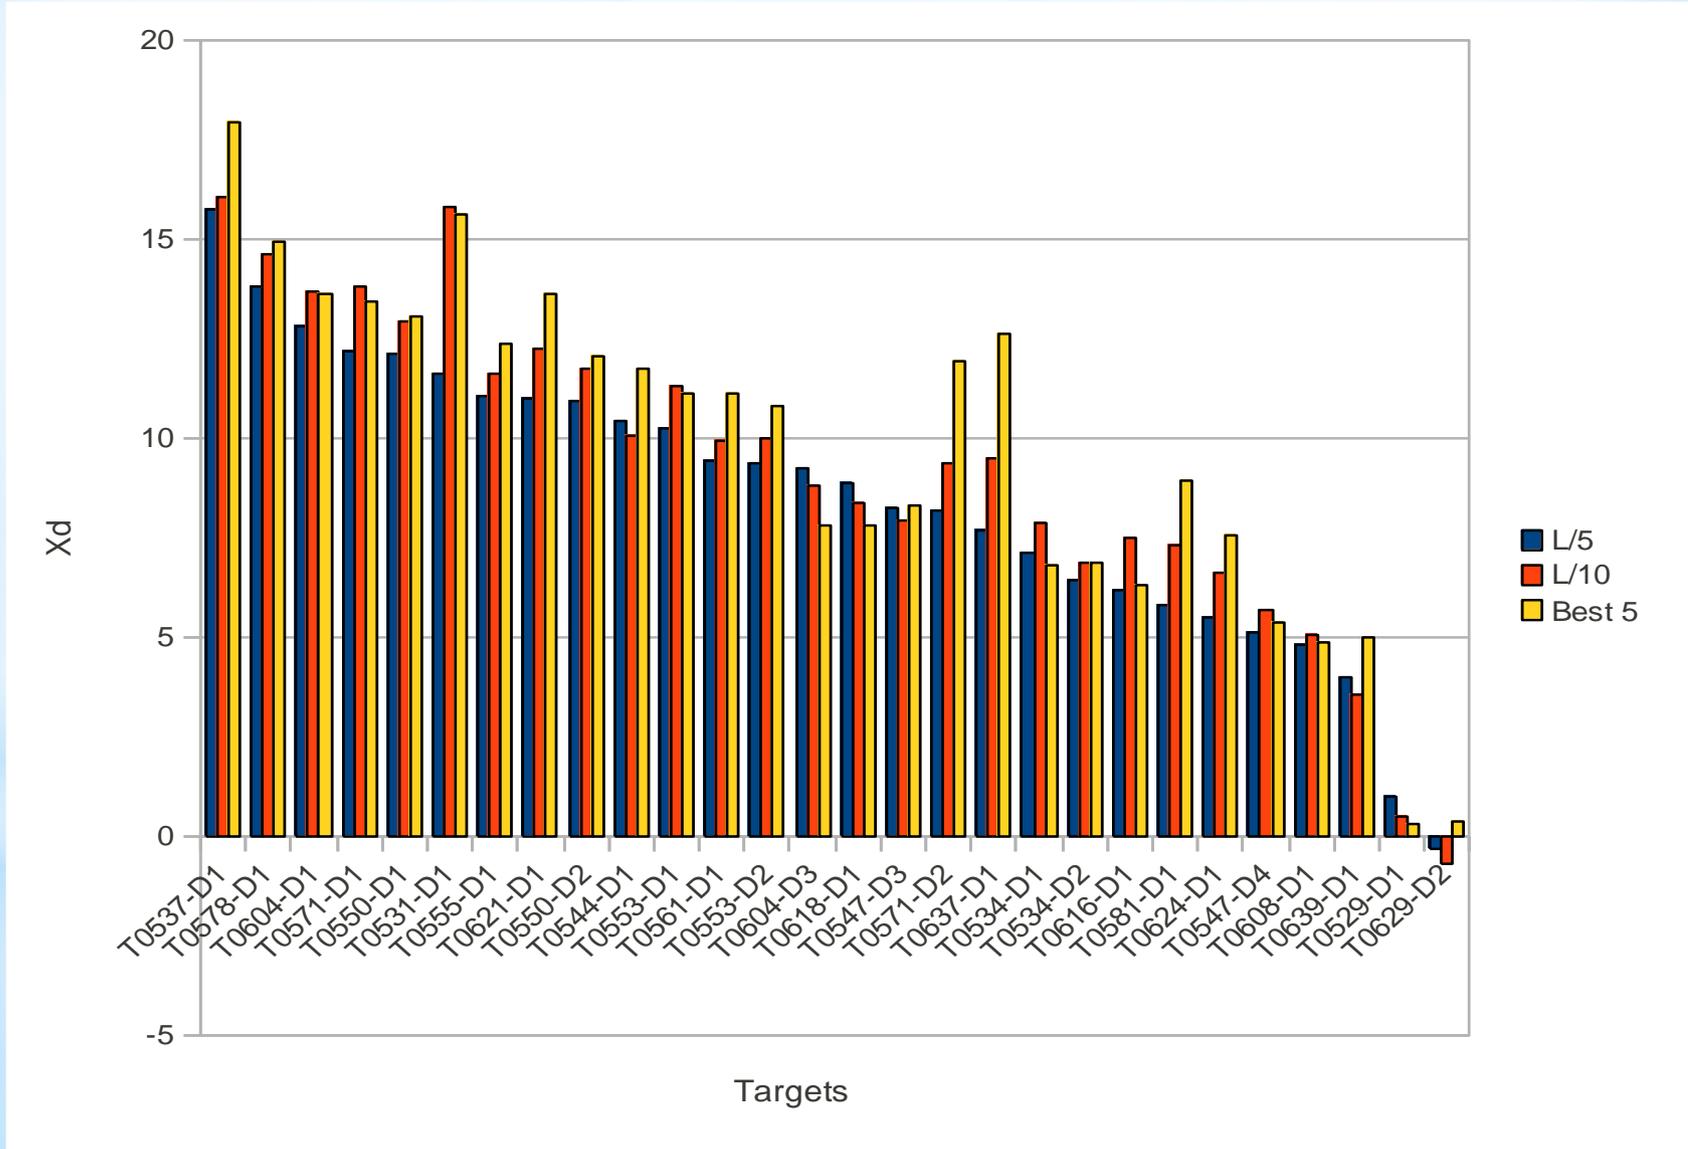

# Acc per target

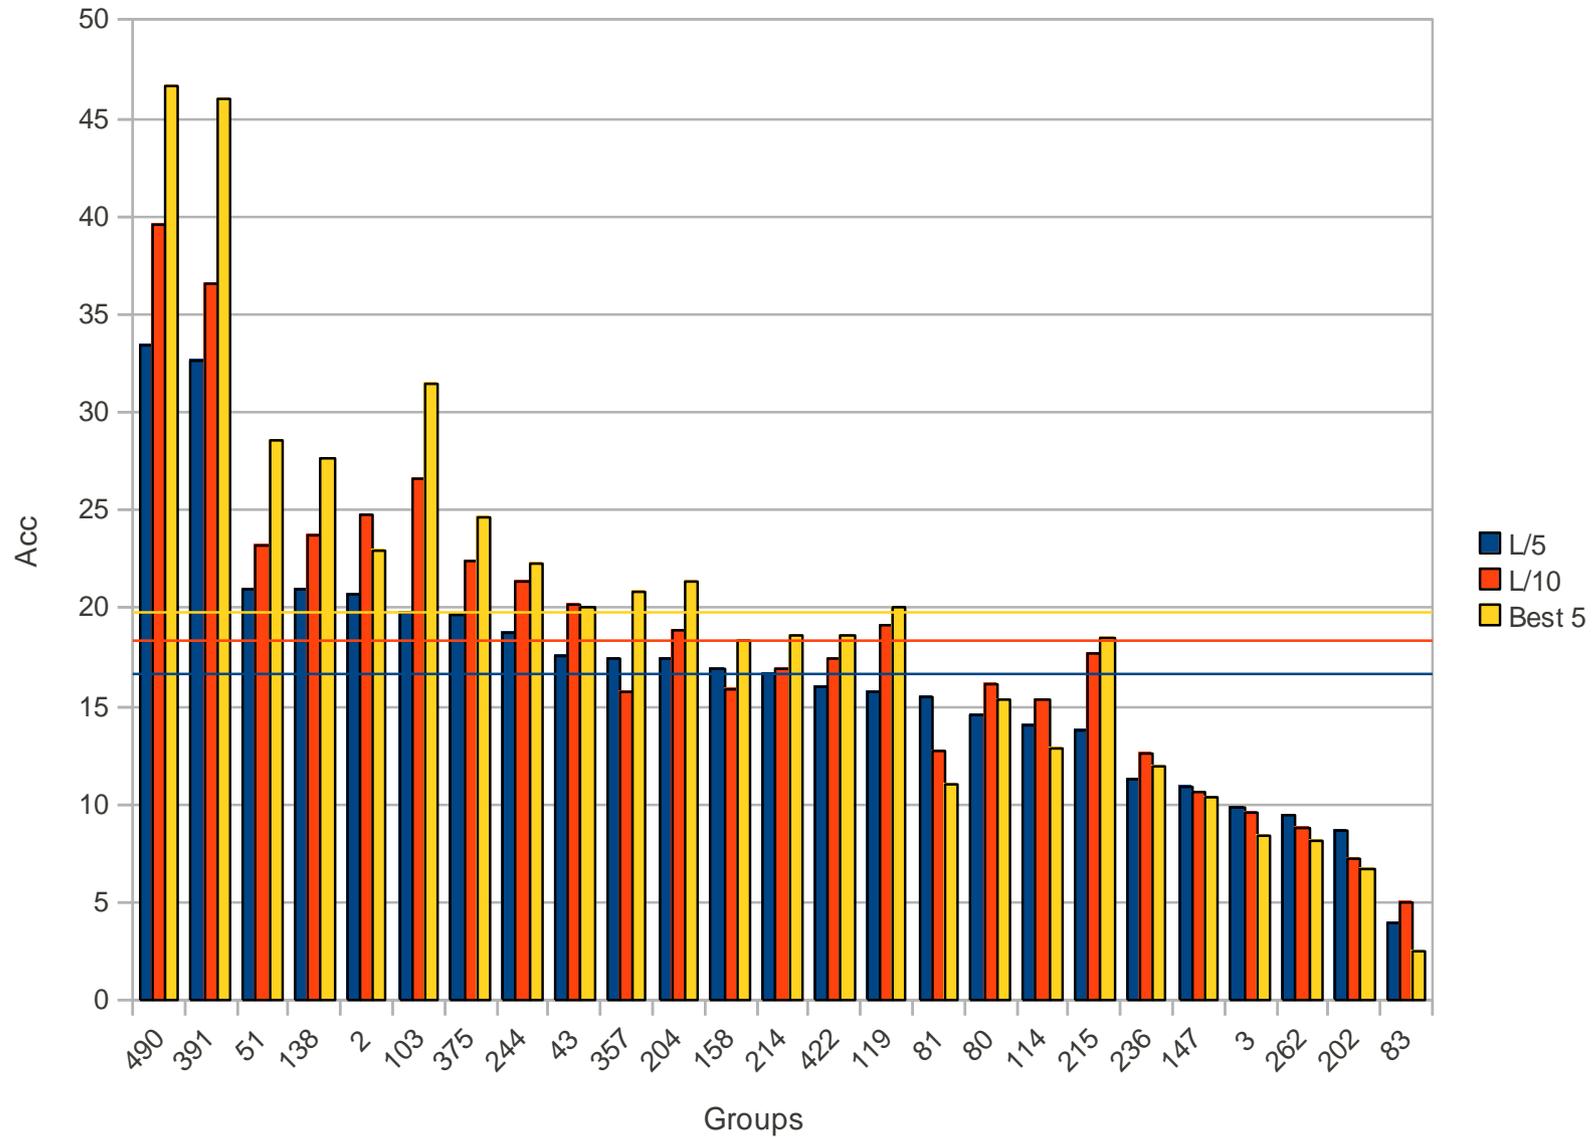

# $X_d$ per target

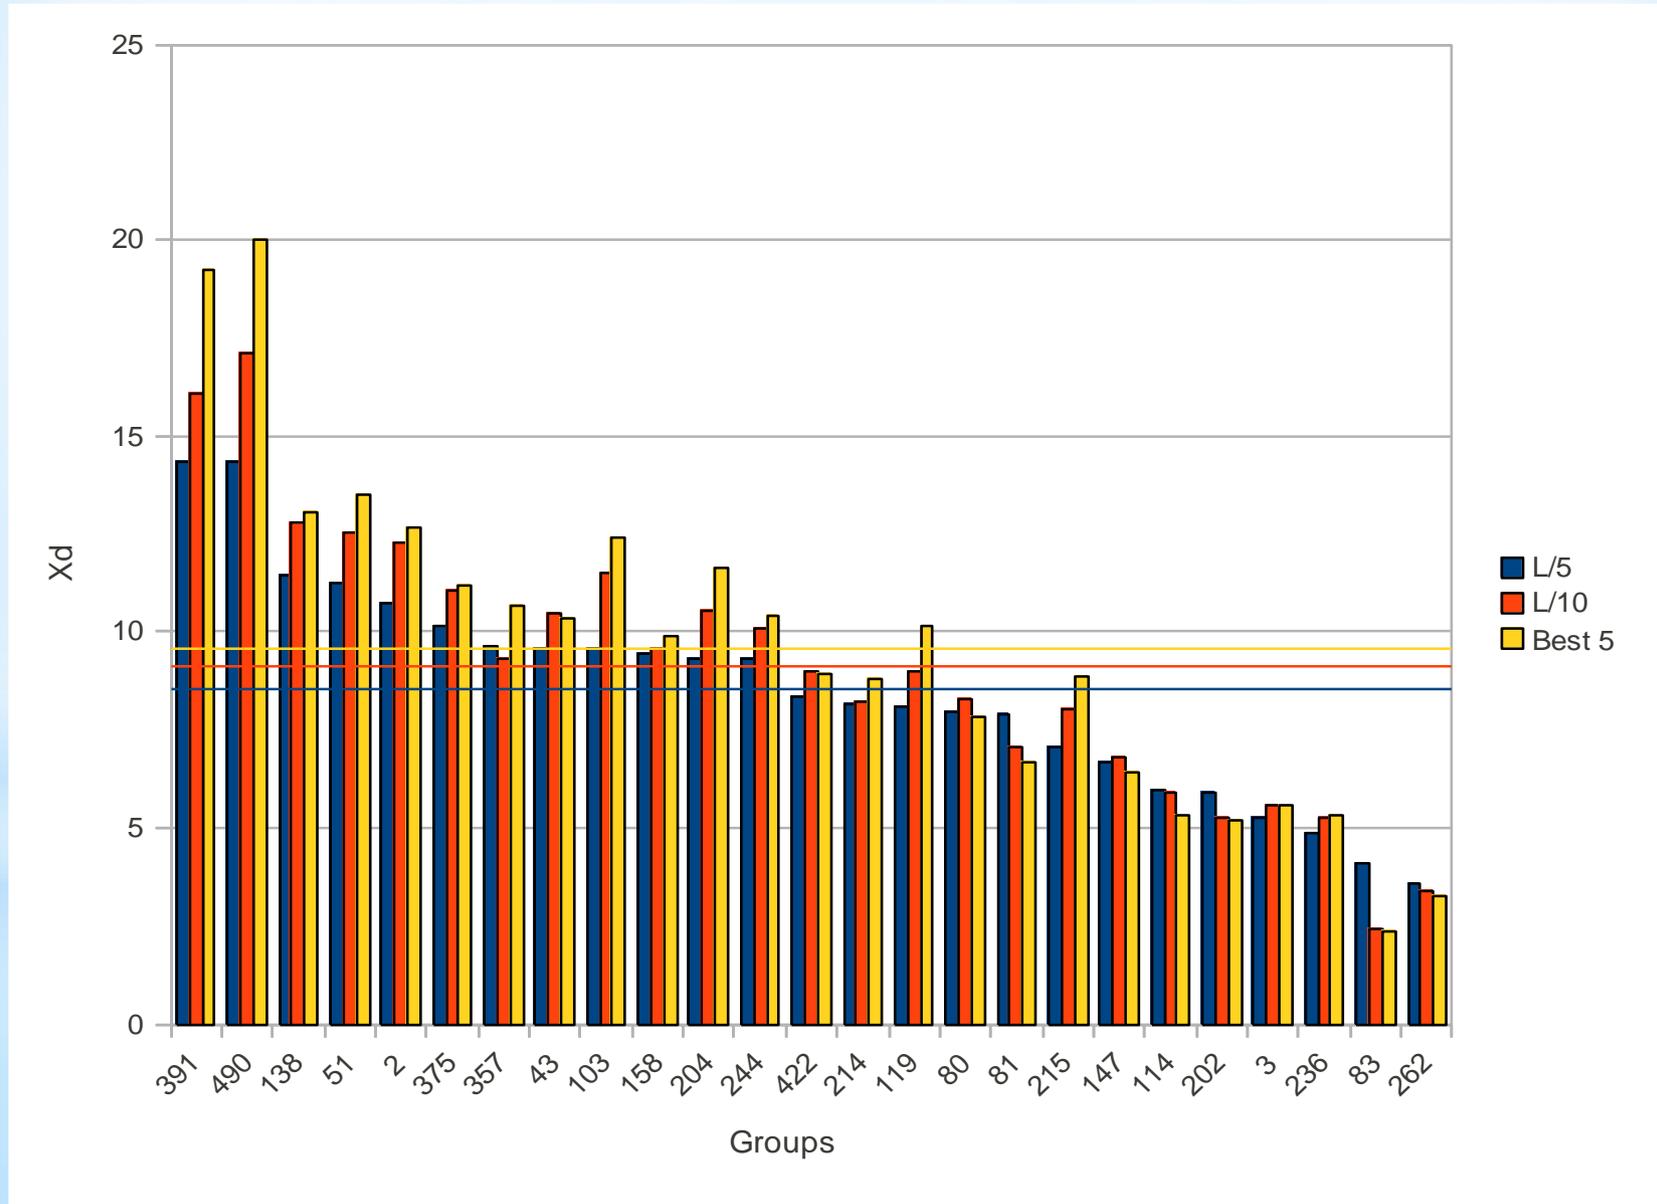

# Acc per group

# $X_d$ per group

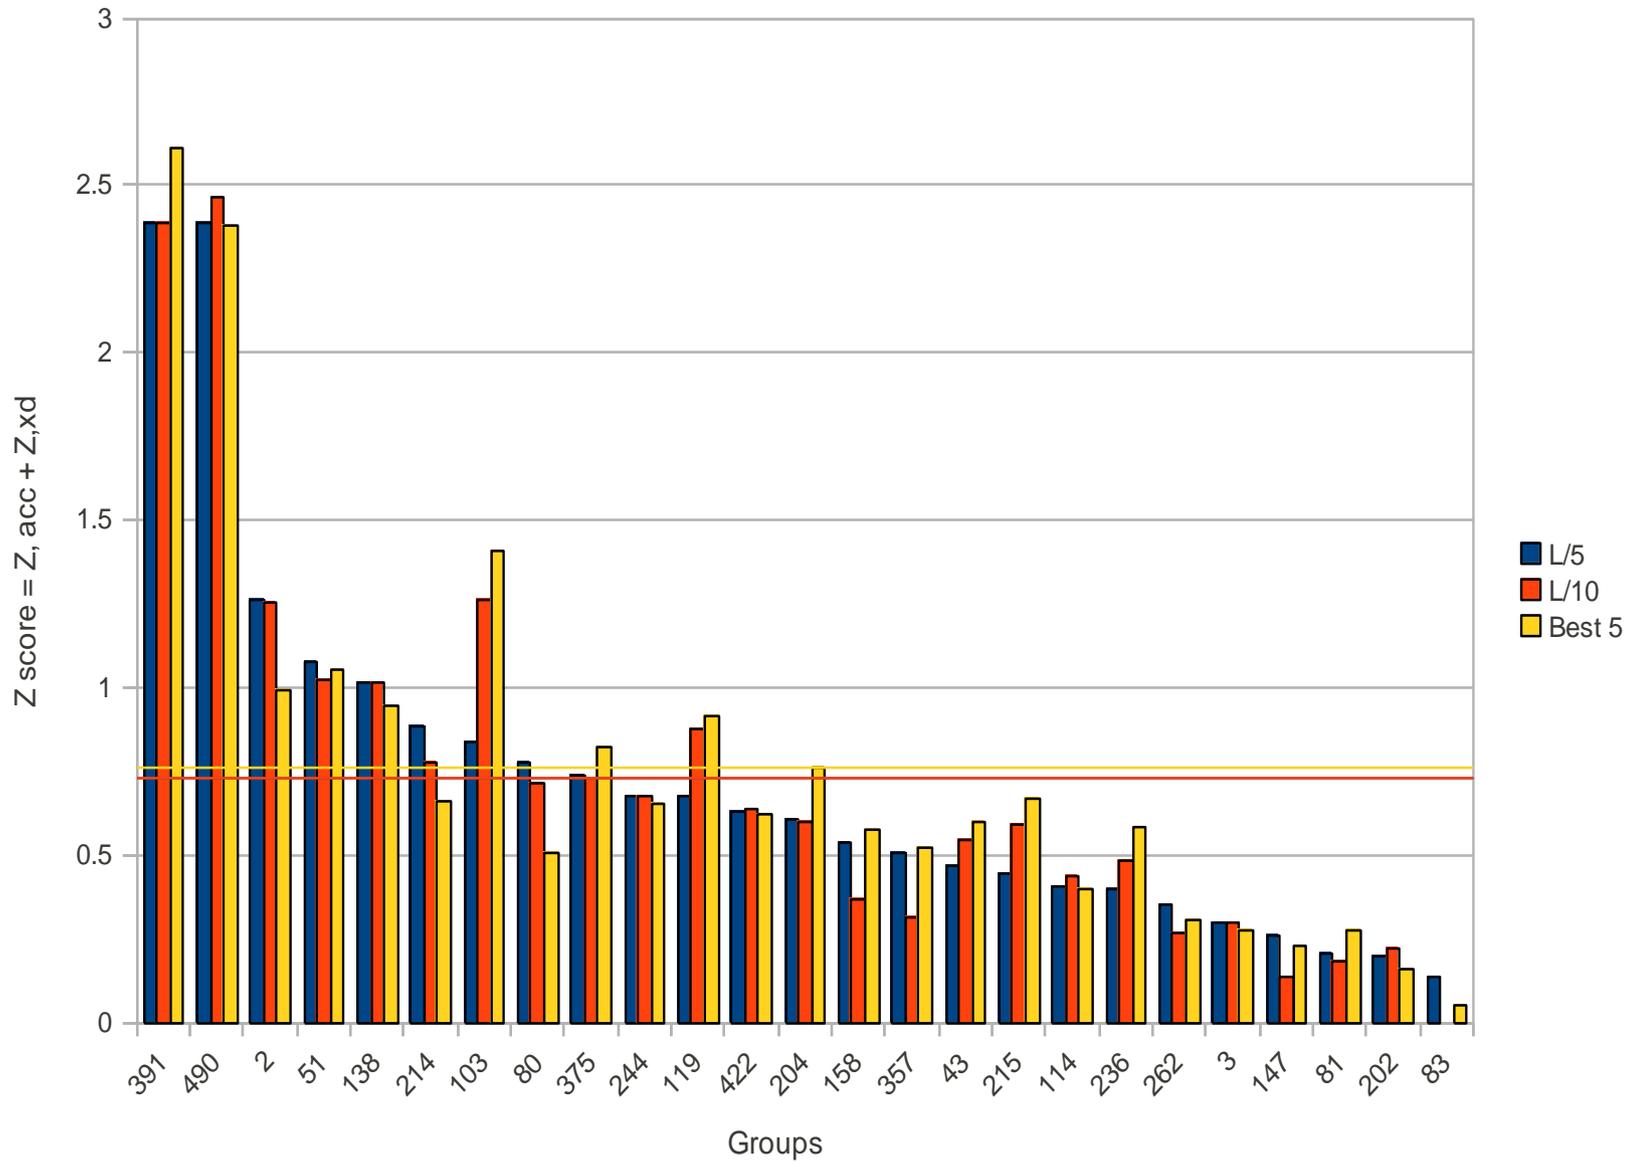

The groups were ranked according to the cumulative Z score (removing outliers):

$$Z_{\text{total}} = Z_{\text{Acc}} + Z_{\text{Xd}}$$

# Z, total

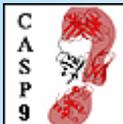

## T test for groups (Acc score, L/5)
