Institute of
Biotechnology

- ▶ Protein assemblies
- ▶ Protein-RNA interactions
- ▶ Large multidomain proteins

Generate an ensemble of diverse models and select the best of them

Sampling using AlphaFold

- ▶ AlphaFold with `full_dbs` and `reduced_dbs` presets
- ▶ ColabFold using MSA with additional sequence databases:
 - ▶ MMseqs2 on ColabFoldDB
 - ▶ IMG/VR v3
 - ▶ Custom Mgnify coding sequences DB
 - ▶ UniProt TREMBL
 - ▶ NCBI NR
- ▶ More ColabFold:
 - ▶ Pairing of multiple sequence alignments
 - ▶ Number of recycles (3-100)
 - ▶ Multimer modeling using AlphaFold-ptm

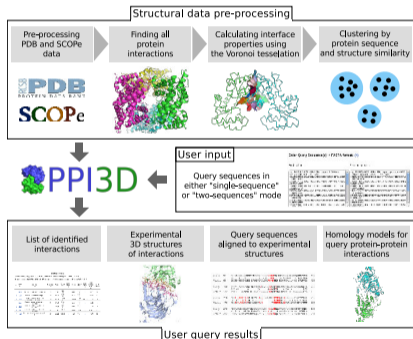

Poster 23: Challenges in modeling protein assemblies with AlphaFold: a case of anti-CRISPR complexes

Analysis of the available data for manual model re-ranking

- ▶ Search and model protein complexes using PPI3D
- ▶ Sequence-based homology search by HHpred and COMER
- ▶ Structure-based homology search with DALI
- ▶ RCSB Advanced Search
- ▶ UniProt
- ▶ Scientific literature
- ▶ Disorder prediction

Methods from our lab: PPI3D and COMER

Dapkūnas & Margelevičius, **2022**, submitted

We used rigid body docking methods:

- ▶ FTDock and Hex for hetero-oligomers
- ▶ SAM for homo-oligomers

Our docking strategy:

- ▶ Select a diverse set of monomers from AF2 and template-based models.
- ▶ Dock as exhaustively as possible.
- ▶ Score and rank all the generated complexes with our interface-focused methods.
- ▶ Relax top 300 docking models with OpenMM.
- ▶ Pool the relaxed docking models together with AF2 and template-based models, then score and rank everything.

Interface-focused scoring

We used our methods that analyze Voronoi-tessellation derived interface contacts:

- ▶ fast interface VoromQA-energy and (a bit slower) VorolF-GNN for quality assessment
- ▶ fast interface CAD-score (contact area difference score) for comparison and clustering

Ranking with Vorolf-jury

Collect all models from all sources (AlphaFold2, docking, TBM)

Score and rank using different methods

Vorolf-GNN
res. Vorolf-GNN
VoromQA-energy
V-select 2018
V-select 2020
VoromQA-dark
VoromQA-light

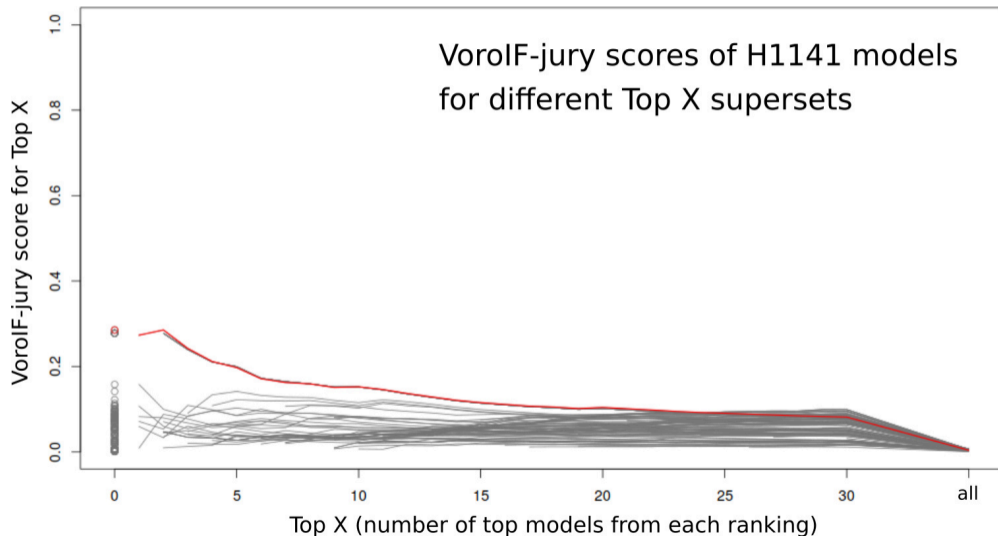

Compute interface CAD-score consensus scores for supersets of top models

Calculate max achieved "Top X" consensus for every model and use it for the final ranking

VoroIF-jury scores plot

AlphaFold produces high-quality models for multimers

Symmetry docking

AlphaFold

H1114 (model H1114TS494_1)

$A_4B_8C_8$

▶ A_4 : AlphaFold

▶ B_2C_2 : AlphaFold

▶ A_4B_2 : AlphaFold

▶ Align and refine

Manual selection of models is sometimes useful

Both AlphaFold and docking work or fail for antibody-antigen interactions

F1 (ICS) 79
Jaccard (IPS) 0.79

- ▶ AlphaFold predicts structures of protein complexes well
- ▶ AlphaFold fails to model large protein assemblies
- ▶ Selection of models using different scores and other information is important
- ▶ Antibody-antigen interactions are hard to predict
